

| Summary of Hydrocarbon Classification | | |
|---------------------------------------|--|--|
| Compound Type | Functional Group | Example |
| alkanes | none (no double or triple bonds) | $\text{CH}_3\text{—CH}_2\text{—CH}_3$, propane |
| alkenes | >C=C< double bond | $\text{CH}_2\text{=CH—CH}_3$, propene |
| alkynes | $\text{—C}\equiv\text{C—}$ triple bond | $\text{H—C}\equiv\text{C—CH}_3$, propyne |
| aromatics | benzene ring |  ethylbenzene |

atom. These alkanes differ only by the number of methylene groups in the chain. If the molecule contains n carbon atoms, it must contain $(2n + 2)$ hydrogen atoms. Figure 3-1 shows this representation of alkane structure and how it leads to formulas of the form $\text{C}_n\text{H}_{2n+2}$.

A series of compounds, like the n -alkanes, that differ only by the number of $\text{—CH}_2\text{—}$ groups, is called a **homologous series**, and the individual members of the series are called **homologs**. For example, butane is a homolog of propane, and both of these are homologs of hexane and decane.

Although we have derived the $\text{C}_n\text{H}_{2n+2}$ formula using the n -alkanes, its use is not limited to unbranched molecules. Any isomer of one of these n -alkanes has

TABLE 3-1 Formulas and Physical Properties of the Unbranched Alkanes, Called the n -Alkanes

| Alkane | Number of Carbons | Structure | Formula | Boiling Point ($^{\circ}\text{C}$) | Melting Point ($^{\circ}\text{C}$) | Density ^a |
|-------------|-------------------|--|------------------------------|--------------------------------------|--------------------------------------|----------------------|
| methane | 1 | $\text{H—CH}_2\text{—H}$ | CH_4 | -164 | -183 | 0.55 |
| ethane | 2 | $\text{H—(CH}_2\text{)}_2\text{—H}$ | C_2H_6 | -89 | -183 | 0.51 |
| propane | 3 | $\text{H—(CH}_2\text{)}_3\text{—H}$ | C_3H_8 | -42 | -189 | 0.50 |
| butane | 4 | $\text{H—(CH}_2\text{)}_4\text{—H}$ | C_4H_{10} | 0 | -138 | 0.58 |
| pentane | 5 | $\text{H—(CH}_2\text{)}_5\text{—H}$ | C_5H_{12} | 36 | -130 | 0.63 |
| hexane | 6 | $\text{H—(CH}_2\text{)}_6\text{—H}$ | C_6H_{14} | 69 | -95 | 0.66 |
| heptane | 7 | $\text{H—(CH}_2\text{)}_7\text{—H}$ | C_7H_{16} | 98 | -91 | 0.68 |
| octane | 8 | $\text{H—(CH}_2\text{)}_8\text{—H}$ | C_8H_{18} | 126 | -57 | 0.70 |
| nonane | 9 | $\text{H—(CH}_2\text{)}_9\text{—H}$ | C_9H_{20} | 151 | -51 | 0.72 |
| decane | 10 | $\text{H—(CH}_2\text{)}_{10}\text{—H}$ | $\text{C}_{10}\text{H}_{22}$ | 174 | -30 | 0.73 |
| undecane | 11 | $\text{H—(CH}_2\text{)}_{11}\text{—H}$ | $\text{C}_{11}\text{H}_{24}$ | 196 | -26 | 0.74 |
| dodecane | 12 | $\text{H—(CH}_2\text{)}_{12}\text{—H}$ | $\text{C}_{12}\text{H}_{26}$ | 216 | -10 | 0.75 |
| tridecane | 13 | $\text{H—(CH}_2\text{)}_{13}\text{—H}$ | $\text{C}_{13}\text{H}_{28}$ | 235 | -5 | 0.76 |
| tetradecane | 14 | $\text{H—(CH}_2\text{)}_{14}\text{—H}$ | $\text{C}_{14}\text{H}_{30}$ | 254 | 6 | 0.76 |
| pentadecane | 15 | $\text{H—(CH}_2\text{)}_{15}\text{—H}$ | $\text{C}_{15}\text{H}_{32}$ | 271 | 10 | 0.77 |
| hexadecane | 16 | $\text{H—(CH}_2\text{)}_{16}\text{—H}$ | $\text{C}_{16}\text{H}_{34}$ | 287 | 18 | 0.77 |
| heptadecane | 17 | $\text{H—(CH}_2\text{)}_{17}\text{—H}$ | $\text{C}_{17}\text{H}_{36}$ | 303 | 23 | 0.76 |
| octadecane | 18 | $\text{H—(CH}_2\text{)}_{18}\text{—H}$ | $\text{C}_{18}\text{H}_{38}$ | 317 | 28 | 0.76 |
| nonadecane | 19 | $\text{H—(CH}_2\text{)}_{19}\text{—H}$ | $\text{C}_{19}\text{H}_{40}$ | 330 | 32 | 0.78 |
| eicosane | 20 | $\text{H—(CH}_2\text{)}_{20}\text{—H}$ | $\text{C}_{20}\text{H}_{42}$ | 343 | 37 | 0.79 |
| triacontane | 30 | $\text{H—(CH}_2\text{)}_{30}\text{—H}$ | $\text{C}_{30}\text{H}_{62}$ | >450 | 66 | 0.81 |

^a Densities are given in g/mL at 20°C , except for methane and ethane, whose densities are given at their boiling points.

Figure 3-2 gives the names of the most common alkyl groups, those having up to four carbon atoms. The propyl and butyl groups are simply unbranched three- and four-carbon alkyl groups. These groups are often named as "*n*-propyl" and "*n*-butyl" groups, however, to eliminate any question about which kind of propyl group or butyl group is meant.

▲ **Figure 3-2**
Some common alkyl groups.

▲ **Figure 3-1**
Examples of the general alkane molecular formula, $\text{C}_n\text{H}_{2n+2}$.

the same molecular formula. Butane and pentane follow the $\text{C}_n\text{H}_{2n+2}$ rule; therefore, branched alkanes such as isobutane, isopentane, and neopentane also follow

Name: _____ Date: _____

- A) 6-Ethyl-3,4-dimethylheptane
- B) 2-Ethyl-4,5-dimethylheptane
- C) 3,4,6-Trimethyloctane
- D) 3,5,6-Trimethyloctane
- E) 2-(1-Methylpropyl)-4-methylhexane

2. A correct IUPAC name for the following compound is:

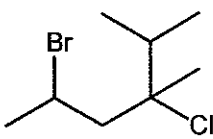

- A) 4-propyl-5-chloro-3-heptanol
- B) 4-propyl-3-chloro-5-heptanol
- C) 4-(1-chloropropyl)-3-heptanol
- D) 5-chloro-4-propyl-3-heptanol
- E) 3-hydroxy-4-propyl-5-chloroheptane

3. A correct IUPAC name for the following compound is:

- A) 3,6,7-trimethyl-4-bromo-1-octene
- B) 4-bromo-3-methyl-6-isopropyl-1-heptene
- C) 4-bromo-3,6,7-trimethyl-1-octene
- D) 4-bromo-6-isopropyl-3-methyl-1-heptene
- E) 4-bromo-6-isopropyl-3,6-dimethyl-1-hexene

4. An IUPAC name for the group $\begin{array}{c} \text{CH}_3\text{CHCH}_2^- \\ | \\ \text{CH}_2\text{CH}_3 \end{array}$ is:
- A) Isopentyl
 - B) Isoamyl
 - C) *sec*-Butylmethyl
 - D) 2-Methylbutyl
 - E) 2-Ethylpropyl

5. The correct IUPAC name for  is:
- A) 2-Bromo-4-chloro-4-isopropylpentane
 - B) 4-Bromo-2-chloro-2-isopropylpentane
 - C) 5-Bromo-3-chloro-2,3-dimethylhexane
 - D) 2-Bromo-4-chloro-4,5-dimethylhexane
 - E) 2-(2-Bromopropyl)-2-chloro-3-methylbutane

6. Alkanes in which some or all of the carbon atoms are arranged in a ring are called _____.

7. Draw the bond-line structural formula corresponding to the name: 2,5,9-trimethyl-2-decen-7-yne
